Problem Statement

Instead of making the patients shift from hospital to hospital for required service and treatment,we give all necessary information about all the hospitals from the applications itself.

This system helps user to choose Hospital on the basis of their needs at the same time helps them to check if that service/department is open or available for them instead of going on site . This will remove intermediate phase of calling the hospital to enquire details from them

The software used for Hospital Tracking System

- 1. MySQL
- 2. Python
- 3. MySQL Connector

Hospital Prediction System

Hospital in patient's area
 Department available
 Match both conditions
 List of hospital available in particular area
 Department available for particular disease or medical condition
 Match both condition to favor patient

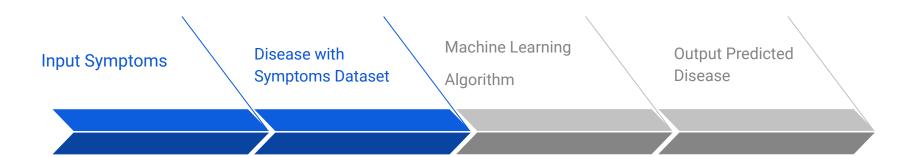

The software used for Disease Prediction System

- 1. Python
- 2. CSV file
- 3. Library used: Numpy and Pandas

Disease Prediction System

THANK YOU
